

Krass India

Case Studies for Herbal Nutritional Supplement for Down's syndrome

Child Name: Anchal

Location: Delhi, India

Age at Pre-treatment: 4 years

Diagnosis: Down's syndrome (Delayed speech and development)

Pretreatment evaluation – Nov 12th, 1994

All milestones usually reached in case of a regular child were grossly delayed in case of Anchal. She was not able to perform her day-to-day activities in form of self-help skills (Brushing, eating, dressing, undressing etc.). No Social help skills had been developed. Her speech was monosyllabic and could not be comprehended clearly. She was able to stand but not able to walk without support. She did not have the capability to grasp things related to preschool performance (body parts, animal recognition etc.) and there was no sign of her performing any extracurricular activities.

A SPECT brain was not carried out because this facility was not available at Jaipur, India at that time.

Supplementing with herbal nutritional supplement:

We put her on the Herbal nutritional supplement developed by Krass India, which was administered to her as per guidelines on a regular basis. Close monitoring was done to see any adverse reaction to the nutritional supplement. Once she was comfortable with the dose, a training model was developed for her to observe improvements in her regular day-to-day working.

Post treatment evaluation (December 29th, 1996 – 24 months later)

After completion of 24 months of supplement, we compared Anchal pre-treatment evaluation to current and her parents were very happy with her progress and performance while she was on the Herbal Nutritional Supplement. Anchal could walk, run and play as any regular child. She mixed very well with peer age group children and developed social help skills. She started helping her mother in housework and her reflex response developed exceptionally well. She is able to do mouth rinsing, hand washing, brushing, bathing (still need some help), dressing (still need some help), undressing, and eating all by self without any support. She developed toilet control and bowel control also. She could do cosmetic make-up activities too. She developed normal speech and started recognizing names of all body parts, animals, birds, vegetables, fruits, vehicles, general kitchen and household items. She recognized most major colors like red, green and yellow colors, and regular shapes like circle, triangle and square. She showed interest in dancing and developed reflexes (in the form of dancing) to tunes she heard around. She was able make pictorial drawing. She started attending primary school, where she also mixed well with other children and made friends. She could pronounce and recognizes alphabets but still has some difficulty in writing.

After completion of 36 months of treatment tremendous improvement in school performance was observed. (A report by father is given below).
